This Document explains the additional functions added in Voicemeeter Banana (Voicemeeter pro version).

if you are not familiar with Voicemeeter, we recommend to read first the User Manual of Voicemeeter Standard version. www.voicemeeter.com

INSTALLATION:
Run setup program and follow instructions.
Reboot after installation or de-installation

IMPORTANT NOTE: If you do not reboot after de-installation, virtual audio drivers might not be completely de-installed and prevent you to install new version correctly. If it happens, you will be obliged to de-install Voicemeeter’s Virtual audio devices manually. (by the system / device manager windows system procedure).

ONLINE SUPPORT

Fair Trade, Affordable For Everyone
Voicemeeter is a donationware, free to download and free to use! It allows you to adjust the license price according to your means or usage. Thanks for your participation and support!

INTRODUCTION:

Voicemeeter Banana is an advanced virtual mixing console able to manage 5 audio inputs (3 physical and 2 virtual) and 5 audio outputs (3 physicals and 2 virtual) through 5 multichannel busses (A1, A2, A3 & B1, B2).

As Mixing Console, Voicemeeter offers large amount of use case combinations: To mix in real time your voice with your music, your movie, your video game or web radio and share it on internet through VOIP applications. Voicemeeter is also able to let you manage 3 Headsets and create new VOIP experiences …

Voicemeeter Banana integrates an audio recorder able to generate BWF, WAV, AIFF, or MP3 file in stereo. (and 4, 6, or 8 channels for WAV / AIFF format). Recording options allow recording any pre-fader inputs or post fader BUS. Special Composite Mode will allow to record pre or post fader inputs in multichannel mode.

Voicemeeter Banana offers a 6 cells full parametric EQ on every BUS, with the possibility to make independent equalization on each channel (1-to 8). This is made to correct your P.A. System from mono to 7.1 setup. In conjunction with Stereo Repeat Mode, it’s also possible to use this Equalizer as stereo Cross Over to drive 2, 3, or 4 ways active speakers system.

Finally Voicemeeter Banana provides a better control on Compression / Gate effect by presenting 2 different knobs and adds another modulation effect panel on the 3 physical input strips.
Voicemeeter Banana implements a simple matrix to let you manage input to output routing, and make mix minus processing for every strips. So we have 5 push buttons per strip: A1, A2 A3 and B1, B2 to send each strip to whatever busses.
Voicemeeter Banana as Universal Virtual Audio Device:
Voicemeeter offers Virtual Audio Point on Input #4 & #5 and on BUS B1 and B2. These Virtual Audio I/O’s (VAIO) support all possible Audio Interfaces and allows connecting any audio applications, including audio pro DAW or musical instrument working with ASIO devices.

Audio interfaces type supported by Voicemeeter Virtual audio I/O (Voicemeeter VAIO).

<table>
<thead>
<tr>
<th>Interface Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MME</td>
<td>The MME API or the Windows Multimedia API (also known as WinMM) was the first universal and standardized Windows audio API. This audio interface type is expected to work with whatever audio device but with latency time possibly around 100ms.</td>
</tr>
<tr>
<td>WDM</td>
<td>That we call WDM (Windows Driver Model) audio interface in Voicemeeter is handled by WASAPI: the Latest Microsoft Audio Functions to get best audio performances and small latency (&lt; 30ms) – available since Windows VISTA.</td>
</tr>
<tr>
<td>KS</td>
<td>Kernel Streaming or Direct Kernel streaming API allows low latency audio streaming, since Windows XP, but unfortunately not all audio devices provide this interface.</td>
</tr>
<tr>
<td>WaveRT</td>
<td>The WaveRT miniport driver is supported in Windows Vista and later Windows operating systems and can offers good audio performances and small latency (comparable to KS).</td>
</tr>
<tr>
<td>Direct-X</td>
<td>Direct-X Audio Interface is used by Video Game and some audio software. Latency is usually comparable to MME.</td>
</tr>
<tr>
<td>ASIO</td>
<td>Audio Stream Input/Output (ASIO) is a computer sound card driver protocol for digital audio specified by Steinberg, providing a low-latency and high fidelity interface between a software application and a computer's sound card.</td>
</tr>
</tbody>
</table>
Voicemeeter as Audio HUB and Next Gen Audio Engine:
Voicemeeter now includes VBAN features and Voicemeeter Remote API. VBAN allows to send / receive audio stream to / from any computers of a local network. Voicemeeter Remote API allows developing client applications and taking advantage of all Voicemeeter features, inter connection with all audio interfaces type, audio device aggregation, mixing/routing functions, MIDI and VBAN features, to create new powerful audio applications.

Voicemeeter is installed with Macro Buttons Application offering programmable buttons to act on Voicemeeter by simple request script

Voicemeeter package also installs VoicemeeterRemote.dll and VoicemeeterRemote64.dll for client application willing to control Voicemeeter by program.

More information on our forum:
http://vbaudio.jcedeveloppement.com/forum/viewforum.php?f=8&start=0
Quick Startup Guide

Voicemeeter is a virtual audio mixer intended to replace the Windows Mixer. The quickest way to configure Voicemeeter is to simply use it as default device and connect it to your main playback device. Then all PC sounds will go through Voicemeeter before playing back to your speakers.

1. Install Voicemeeter...
   2. Configure default Audio Device...

   ...and REBOOT your computer

   ...set Voicemeeter Input as default

3. Launch Voicemeeter Application...

   ...select Audio Device for output A1

4. Set Voicemeeter In System Tray...

   ...to replace Windows Audio Mixer

Remarks in case of problem.

Installing Voicemeeter means installing audio driver. In some cases, the system might declare this new driver as default driver (as default playback device for example). Consequently you do not hear anything anymore since you do not run and configure Voicemeeter and your system audio correctly (as it is shown above).

Windows System Audio Configuration is mainly located in Windows Control Panel / Sound Dialog Box. This is where you have to go to check or set what is your default playback device and what is your default recording device (and the Communications option has to be set to "Do Nothing" if you use Voicemeeter with VOIP applications).

In all cases, all is a question of audio configuration and it does not need to remove Voicemeeter in case of problem. Voicemeeter is a simple Application endowed with an audio device driver, if you don’t use it, there is no way to get trouble. But if you do, you need to avoid possible audio device conflict and connect everything to Voicemeeter (to prevent other application to use audio playback device already used by Voicemeeter).
Connecting Voicemeeter to Audio device:

To make Voicemeeter working, you need at least to select the main output device used for BUS A1. We recommend to select your best audio device here because it will be considered as the master Audio Point giving the master sample rate and buffer size. ASIO or WDM device type usually allow to get best performances (ASIO is present only for output A1).

The main audio output device A1 can work in 32 kHz, 44.1 kHz, 48 kHz, 88.2 kHz or 96 kHz. This will also be the main sample rate of the entire mixing process and Virtual ASIO points (Voicemeeter will support whatever sample rate on other inputs or outputs points).

REM: If selecting an ASIO device for output A1, Voicemeeter's inputs strips (if not already set) will be automatically connected to related ASIO inputs (2 by 2) - until you select another audio device on hardware inputs – Then it's possible to use a single ASIO board to manage 3x stereo input and 8 channel output (output BUS supports up to 8 channels).
Selecting Input Devices.

An audio device can be selected for every physical strip by clicking on hardware input strip section. Select audio input device on strip #1, for example your microphone! Then you will be able to listen to your voice in real time.

As you can see on this picture, Input 1 and 2 use default ASIO device input (since it has previously been selected as main audio device for output A1). But it does not prevent to select another audio device input (from another audio device).

REM: it's better to select WDM driver (present since Windows VISTA) to get best latency and audio performances. If using MME driver you might have a bigger delay between input and output. Use MME driver only if WDM are not present or does not work correctly with your audio hardware configuration.

KS can be better than WDM in some cases but not all audio devices are presenting such audio interface. In the example above, Jabra BIZ 2300 USB Microphone and onboard Audio Device are not present as KS device, but only in WDM and MME.
Using Voicemeeter Virtual Inputs.

Virtual I/O are connected to virtual audio devices installed with Voicemeeter. Playback devices are used as virtual inputs while recording devices are fed with output B1 and B2 (the B Busses).
Voicemeeter Virtual ASIO driver
Voicemeeter Virtual I/O support also ASIO interface with 4 different client applications. These 4 possible sources get signal from BUS B1 (for Voicemeeter Virtual ASIO) or B2 (for Voicemeeter AUX virtual ASIO) and their outputs are mixed together on the Virtual Input (with possible PC Sound already coming from usual windows audio interfaces.

All ASIO Clients receive the same audio signal coming from BUS B1 or B2
All ASIO Client outputs are mixed on Voicemeeter Input 4 or 5 with possible audio coming from other PC applications

For Recording Applications, take care about the loop back! You might have MUTED outputs or disable monitoring otherwise output signal will come back on input infinitely.

Configure DAW Application
Select Voicemeeter Virtual ASIO device In whatever audio applications using ASIO

Configure Musical Instrument
Audio Controls.

While you are talking you can tweak your voice in real time with different controls; 2D Panel, Audibility knobs or simple 3 bands Equalizer…

**INTELLIPAN COLOR PANEL**

Based on basic equalizer, this panel will allow you to change the color of your voice in a quick way.

It gives a spectral identity to your voice by acting on 3 frequency bands and a tiny reverb on the half top.

**Position 3D Panel: The Binaural effect.**

If you right click on panel you can switch to another effect able to position audio sources with a simple room effect (works in stereo only).

Voicemeeter includes a binaural effect able to give a spatial identity to audio sources and then increase dialog intelligibility (especially when everyone is talking in the same time).

This effect works in stereo, so can be used when recording a stereo stream to improve the sound of the global mix. This also can be used to simply enhance your voice to stereo.

This kind of “psycho acoustic” effect is used a lot since decades in audio production to create a better “audio scene” by positioning some music tracks on different virtual location. Today several FOH live mixing consoles are proposing such advanced Pan Pot, mainly because it allows saving audio energy – while the regular pan pot could completely remove the sound from left or right.
Modulation Fx.
If you right click on 2D Panel you can also get the Modulation panel below.

Based on Chorus effect, this panel allows to make various effects. Just experiment by placing cursor wherever you want. Basically chorus / phasing effect are on the bottom while modulations are on the top. Modulations with feedback are on the left side while simple modulation is on the right side. Depth is given by the distance to the middle of the panel.

Compressor / Gate.
On each input strip there are two knobs to set compression and gate effect.

Compression is made with “auto make up”. Consequently it gives a big boost to your voice while compressing it. Then you can adjust the compression gain by decreasing the fader gain.

Equalization / 5.1 Pan Pot.
On both Virtual input strips, there is a simple 3 bands Equalizer and 5.1 Pan Pot.

**EQUALIZER**
3 Bands Equalizer to boost or remove bass, medium and high frequency (treble).

**5.1 Pan POT**
Below the Equalizer a small 2D Panel allows 5.1 balance. It’s a simple process to position the sound source in one of your 5 speakers:
- front left
- Front Center
- Front Right
- Rear Left
- Rear Right

*Trick: All controls go back to default value if double click on it!*
BUS Master Parametric EQ.
Each BUS offers an EQ button to switch ON/OFF the Master 6 Cells Full Parametric EQ. Right Click on this EQ button to open the EQpro-G6 Dialog Box.

It provides 6 EQ Cells for the 8 possible channels of the BUS. The Channel Selector allows working on all channels in the same time or on a given channel only.

FLAT button will reset the Equalizer (according the channel selector)

A / B provides two different memories to define 2 different equalization settings and compare them just by switching to A or B. EQ settings are always done in current selected preset (A or B).

CH COPY: copy EQ settings of the current channel (to copy current channel equalization to another channel for example).

COPY ALL: copy EQ settings of all channels (to copy entire equalization to another BUS for example).

RIGHT CLICK on Gain / Q / Frequency Control to open a small Edit Box to enter value manually / precisely.

EQ Dialog Box System Menu offers two functions to simply LOAD / SAVE your EQ settings as a XML File (for the current BUS with its 8 channels).

Then it is possible copy the BUS EQ settings from a BUS to another... or/and share it with other users.
Special Routing Options on Output BUS.
Voicemeeter provides additional routing modes for all Busses in order to use the possible 8 output channels in different ways.

**MIX DOWN**
This button is made to make a stereo mix-down with 5.1 or 7.1 sound coming from DVD player on virtual input (strip #3). Left and right channels, Center, Sub and rear are combined to output on stereo speakers.

**MIX DOWN A**
Rear & side Speaker are mixed out of phase to simulate surround effect in stereo

**MIX DOWN B**
Rear & side Speaker are mixed in phase

**STEREO REPEAT**
This button is made to use possible 8 outputs channels with a stereo signal. This stereo signal is repeated to channel 3, 4 / 5; 6 and 7, 8.

**MIX DOWN A (Processing)**
LEFT = FL + (70% FC) + SW + RL - SL  
RIGHT = RL + (70% FC) + SW - RR + SR

**MIX DOWN B (Processing)**
LEFT = FL + (70% FC) + SW + RL + SL  
RIGHT = RL + (70% FC) + SW + RR + SR

**COMPOSITE**
This last mode is made for audio post production. The 8 channels of the BUS can be composed by whatever pre-fader or post fader inputs (or default BUS channel): In the System Settings Dialog Box, user can define the Composite Patch.

With composite signal, it’s possible to record up to 8 channels composed by any Voicemeeter Inputs or with a DAW connected to Voicemeeter virtual ASIO, or with the integrated recorder. for example. It allows recording VOIP interview or conference and making post production process after, with up to 8 different tracks.
Since version 2.0.3.4, additional BUS modes are also present to up mix or extract specific channels:

For example
- To extract LFE channel and send it to sub devices (sub woofer, Buttkicker, Subpac…).
- To send 5.1 Rear channel to wireless speaker (Bluetooth).
- To send Center channel on specific speaker device.
- To use 2.1, 4.1, 5.1 or 7.1 PA system with stereo audio sources.

Additional application:

It is also possible to get total control on 8 channels with a small application called 8x8 Gain Matrix, to redistribute all 8 channels of a 5.1 or 7.1 audio signal coming from your DVD player or Video Game.

This free application for Voicemeeter can be found on our forum here:

All Voicemeeter BUS Mode (12):
Here below the list of 12 BUS Mode to manage the 8 channels of the BUS in 12 different ways.

Normal Mode:
All channels are sent AS IS

MIX DOWN A
LEFT  = FL + (70% FC) + SW + RL - SL
RIGHT = RL + (70% FC) + SW - RR + SR

MIX DOWN B
LEFT  = FL + (70% FC) + SW + RL + SL
RIGHT = RL + (70% FC) + SW + RR + SR

STEREO REPEAT:
ch1 = FL, ch3 = FL, ch5 = FL, ch7 = FL
ch2 = FR, ch4 = FR, ch6 = FR, ch8 = FR

COMPOSITE MODE:
Contains pre fader inputs given by the COMPOSITE PATCH

UP MIX TV (create 7.1 from stereo)
FL = L, FC = 20%(L+R), RL = 70%(L-R), SL = 70%(L-R)
FR = R, SW=50%(L+R), RR = 70%(R-L), SR = 70%(R-L)

UP MIX 2.1
FL = L, FR = R, SW=50%(L+R).

UP MIX 4.1
FL = L, FR = R, SW=50%(L+R).
RL = L, RR = R

UP MIX 6.1
FL = L, FR = R, SW=50%(L+R).
RL = L, RR = R SL = L, SR = R

CENTER ONLY (extract Center)
LEFT  = FC
RIGHT = FC

LFE ONLY (extract sub woofer)
LEFT  = SW
RIGHT = SW

REAR ONLY (extract rear)
LEFT  = RL
RIGHT = RR
ASIO Routing Capabilities.

With Voicemeeter 1.0.5.0 / 2.0.3.0 it is possible to route all physical inputs and busses to possibly 64 I/O of the ASIO Driver selected as output A1. It is the optimal way to use Voicemeeter with a professional audio board.

This is possible by selecting no device for physical input / physical bus. Then the system settings dialog box proposes to select input channels / or output channels for bus A2 and A3:

- Physical Input #2 gets audio from ASIO input channels 3+4
- Physical input #3 gets audio from ASIO input channels 5+6
- BUS A1 automatically uses 8 first output channel of the ASIO board
- BUS A2 will send audio to ASIO output channels 63+64
- BUS A3 will send audio to ASIO output channel 10 to 17 (8 channels).

WARNING: BUS outputs are copied in the ASIO output channels in logical order A1, A2, A3. It means that A1 channels (1 to 8) could be replaced by A2 channels (if overlapping). For example if A2 is routed to channel 1+2, it will overwrite output A1 channel 1+2 (you won’t hear the BUS A1 anymore, since it is replaced by A2).
Integrated Recorder

Voicemeeter Banana provides a simple player recorder to playback whatever WAV, AIFF, MP3, M4A, MP4, MOV, AVI, WMA, WMV files and to record easily everything in WAV, BWF, AIFF or even MP3 format:

Click on cassette top to select audio file to playback. Click on progress bar to position playback cursor in audio file. You can click on RECORD at any moment. It will generate an audio file in your document / Voicemeeter folder with an automatic name with a prefix, the current date, start time and current file extension:

Example: **Record 2015-01-02 at 11h23m24s.wav**

Recording Options

Right Click on Tape Desk to get this recording option dialog box below:
Per default recording options allows to record all pre fader inputs to simply record everything coming in Voicemeeter. But you can decide to record as well the output of a BUS.

**PRE-FADER INPUTS**
This option allows recording one or all inputs in stereo (mixed together), independently from the fader gain (and mute and solo states). This option is made to record original incoming audio signal, but all sources are mixed together with its original gain.

**POST FADER OUTPUTS**
This option is made to record the outputs of a BUS (from 2 to 8 channel) possible with COMPOSITE options. In other word this option allows to record what you hear on the selected BUS. Note that you can use a BUS not connected to an audio device to make a source assignment only for recording.

**FILE OPTIONS:**
The target directory and prefix of the filename can be defined by clicking on the related field and select new directory or enter new prefix (prefix is Record if nothing is defined).

**FILE TYPE:**
File type can be defined as WAV, BWF, AIFF or MP3 (32 to 320 kbps). MP3 can record stereo only while other format can support up to 8 channels (when recording a BUS).

File format, including sample rate, is defined independently than the format used by Voicemeeter. For example, the recording file format can be set in 48 kHz while Voicemeeter is running in 44100 Hz.

**PLAY ON LOAD:**
This option will playback the file automatically just after selecting it.

**PLAYBACK GAIN:**
This slider control the gain of the audio file being played back.

**STOP RECORD AFTER DURATION:**
Let you define the time of a record session. It’s a simple timer that will stop recording automatically after the given duration (set it to 00:00:00 to disable it). This is for example practical to record a movie or podcast with a known duration.
Menu for Extra functions

By clicking on “menu” area, user gets access to different functions:

The additional menu is there to provide additional functions:

- To Restart Audio Engine.
- To Release Audio File (used by the tape recorder).
- To load or save current settings in a given filename.
- To reset Voicemeeter complete settings
- To set Voicemeeter in system tray (in this case it will run on system startup).
- To decide if Voicemeeter is shown on Windows startup.
- To set Voicemeeter as always visible (window on top).
- To Run Macro Button Application on Voicemeeter launch.
- To hook key to control volumes on Voicemeeter with keyboard (Output A1 or Strip #1 level).
- To open different configuration dialog boxes (System settings, Recording options, M.I.D.I. mapping, VBAN Dialog Box).
- To shutdown the application
- System Settings Dialog Box allows to configure parameters related to audio device management.
- Tape Recorder Option Dialog Box is made to configure the audio file recording process.
- M.I.D.I. Mapping Dialog Box allows to connect a M.I.D.I. Remote surface to Voicemeeter.
- VBAN Dialog Box will help you to configure the VB-Audio Network functions, to send/receive audio stream to/from any computer of your local network.
VBAN

VB-Audio Network
VBAN: VB-Audio Network

VBAN Protocol, based on a simple UDP protocol, has been designed for real-time transport of digital audio stream in IP-based network environments. It provides an easy ways to send / receive audio to / from any computers on a local network.

Click on VBAN icon to open the configuration dialog box below and configure your incoming stream (the audio stream from other computer you want to hear) and your outgoing stream (the audio stream you want to send to other computers).

With Voicemeeter Banana, it is possible to listen 8x streams (on any input) and send 8x streams to 8x different computers or mobile devices (audio source is given by selected BUS output).

A VBAN Stream in Voicemeeter can be set in any standard samplerate from 11025 Hz to 96 kHz in 16 or 24 bits resolution with 1 to 8 channels (mono sound to 7.1). It allows transporting high quality audio in native PCM format on your local network.

It is possible to broadcast an audio stream by using the 255 IP Address. For example giving 192.168.1.255 as destination address will send stream to all computers of the network 192.168.1.xxx (REM: such broadcast UDP stream could not pass through router – usually forbidding UDP broadcast)
Configure VBAN Audio Stream

We can configure VBAN stream just by clicking on black fields in the dialog box. An edit box or popup menu will appear to let you define parameters. UDP port used by VBAN is 6980 per default. An Audio Stream is defined by its NAME, IP-ADDRESS FROM (and UDP port). To receive an audio stream these 3 parameters must be the same on receiver.

Send audio stream to other computer:

To select an outgoing stream, define stream name and destination IP-address of the target computer of your local network and switch it ON. The audio stream being sent will come from the selected source (BUS A or BUS B)

Receive audio stream from other computer:

On incoming stream, RIGHT CLICK on “Stream name” area or “IP Address from” area to get the list of current detected incoming stream and select it directly. Otherwise it is possible to edit Stream Name and IP-Address manually. Switch ON the Stream to receive audio on virtual input strip.

NETWORK QUALITY: This parameter, more useful on incoming stream, allows tweaking the audio stream stability in case of bad or busy network. FAST means the network is able to transport audio without delay or error, SLOW is made for busy network, where audio packet can be delayed or lost more often than usual.

ERROR LED: shown on the right are blinking red in case of reception errors:
1- Overload: we received too much packets (audio stream comes too fast)
2- Corrupt: we received corrupted packets
3- Disorder: we received older packets
4- Missing: we missed packets (lost)
5- Underrun: we received not enough packets (audio stream comes too slow)
Additional VBAN-MIDI or Command stream.
Incoming streams section offers 2 other specific VBAN Streams to receive MIDI or TEXT. Opposite to Audio Stream, MIDI or TXT streams do not need an "IP-Address From" and can manage any message coming from anywhere. This is typically done to allow remoting Voicemeeter from several points in the same time. Note the MIDI Stream feeds Voicemeeter MIDI Mapping and is also received by MacroButton.

VBAN MIDI messages and TEXT commands can be sent by MacroButton (see next pages).
VBAN MIDI messages can also be sent by VBAN2MIDI application (installed with Voicemeeter).

VBAN2MIDI application.
This simple standalone application allow converting a physical MIDI input into a VBAN outgoing stream (LEFT Side) and the opposite: from a VBAN MIDI Stream, send incoming data to a physical MIDI output (Right Side).
MACRO-Buttons

Voicemeeter Remote API
MACRO Buttons

Delivered and installed with Voicemeeter, MACRO BUTTONS Application allows creating programmable buttons to control Voicemeeter parameters. It is displaying several (4 to 80) push or 2 positions buttons with a title / sub title and the possibility to assign a keyboard shortcut / mouse / Game pad / MIDI message or even Audio Trigger.

MACRO Button is an independent application using Voicemeeter Remote API. It is also demonstrating the capability to develop a client application to control Voicemeeter by program. This is made to allow creating any new applications, with custom graphic user interface, to make automation, to make VCA or Auto Ducking process or even to process audio directly inside Voicemeeter thanks to the different possible audio interfaces and API's.

MACRO BUTTON application has been designed for Voicemeeter users, to make custom action, or group of actions on the different Voicemeeter controls and parameters:

- To mute a strip or a bus.
- To change the gain on one or several strips / busses.
- To change or toggle BUS assignations on one or several strips.

It is also possible to combine different requests to create a complex action on Voicemeeter. For example a PUSH TO TALK or AUTO DUCKING function could set the MUSIC Gain to -10db and mute other talker in the same time.

- To change voices color/audibility to make special announces.
- To Restart Audio Engine.
- To save or load a complete configuration file.

On Voicemeeter BANANA version, it is also possible to:

- Make voice FX by changing Modulation and Color Panel.
- Launch Sound by the integrated audio player
- Make special correction with the bus parametric EQ
- Remote all VBAN functions

Finally MACRO Buttons also provides system functions to:

- Send Keyboard Event to System Queue (to remote other applications).
- Execute any program (with possibly a command line).
- Send M.I.D.I. Message to 2x possible devices.
- Send VBAN-MIDI / VBAN TXT requests.
Configuring MACRO Buttons

Right click on the button to open the dialog box below and configure your button. It is basically possible to define 3 scripts of request(s); one for initial condition(s) (sent on startup), one sent when the button is pushed and one when the button is released.

![Image of Button Configuration dialog box]

Button type can be PUSH or 2 Positions. Keyboard shortcut dropdown list proposes different Key and Mouse buttons combinations.

M.I.D.I. Implementation allows assigning one M.I.D.I. Event to the button as well. The M.I.D.I. codes are coming from the M.I.D.I. device selected in the Voicemeter M.I.D.I. Mapping Dialog Box and possibly incoming VBAN MIDI stream. Check LEARN box to get message from M.I.D.I. Device. Click on RESET to remove the M.I.D.I. Code.

TRIGGER will allow handling the button according 2 thresholds on a selected input strip level. IN threshold (green cursor) will push the button when level goes over... OUT threshold (red cursor) will release the button when the level goes under. HOLD time define a minimal time to let gate opened.

XINPUT section will let you use up to 4 game pad to control a button.
Voicemeeter Remote Requests

Request is composed by a structured name and a value or a string behind.

Request example with numbers:

- Strip(0).mute=1; // MUTE ON the first strip of Voicemeeter
- Strip(0).mute=0; // UNMUTE the first strip of Voicemeeter
- Bus(0).mono=1; // Set the first BUS in Mono mode
- Bus(0).gain=-10.0; // set BUS Slider Gain to -10.0 dB
- Strip(0).gain=6.0; // set BUS Slider Gain to 0.0 dB

Command.Restart = 1; // request to restart audio engine

Request example with string:

Command.Load = "C:\My Documents\VMConfig1.xml"; //load Config File

Input Strip Parameters:

Strip index is a zero based index related to Voicemeeter version (3 strips on Voicemeeter, 5 on Voicemeeter Banana)

<table>
<thead>
<tr>
<th>Parameter Name</th>

<td>0 (off) or 1 (on)</td>
<td>BUS Mode</td>
<td>1</td>
</tr>
<tr>
<td>Bus[i].EQ.channel[j].cell[k].on</td>
<td>0 (off) or 1 (on)</td>
<td>EQ cell On/Off</td>
<td>2</td>
</tr>
<tr>
<td>Bus[i].EQ.channel[j].cell[k].type</td>
<td>0 to 6</td>
<td>EQ type of the Cell</td>
<td>2</td>
</tr>
<tr>
<td>Bus[i].EQ.channel[j].cell[k].f</td>
<td>20 to 20.000 Hz</td>
<td>Cell Frequency</td>
<td>2</td>
</tr>
<tr>
<td>Bus[i].EQ.channel[j].cell[k].gain</td>
<td>-12 to +12 db</td>
<td>Cell Gain</td>
<td>2</td>
</tr>
<tr>
<td>Bus[i].EQ.channel[j].cell[k].q</td>
<td>1 to 100</td>
<td>Cell Quality</td>
<td>2</td>
</tr>
<tr>
<td>Bus[i].FadeTo</td>
<td>String (dBTarget, msTime);</td>
<td>(dBTarget, msTime);</td>
<td>1</td>
</tr>
</tbody>
</table>

i= bus zero based index, j=channel zero based index (0 to 7), k=cell zero based index (0 to 5).

**Special functions to make timed fade in/out:**

Strip().FadeTo or Bus().FadeTo function allow to set the gain slider with a progressive fade by settings a dB value and a time to reach it (time in ms between 0 and 120000). The parameter is a string since it needs 2 parameters, example:

Strip(0).FadeTo= (-10.0, 500); //will set the slider to -10 dB in 500ms
Strip(0).FadeTo= (-20.0, 2000); //will set the slider to -10 dB in 2 seconds
Bus(0).FadeTo= (0.0, 1500); //will set the bus slider to 0 dB in 1,5 seconds

**System Settings Option:**

Voicemeeter remote API also allows changing different configuration parameters: Patch and System Settings.

**Patch Options**

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Value Range</th>
<th>Remark</th>
<th>Ver.</th>
</tr>
</thead>
<tbody>
<tr>
<td>patch.asio[i]</td>
<td>0 to ASIO input</td>
<td>ASIO Patch</td>

<tr>
<td>Recorder.samplerate</td>
<td></td>
<td></td>
<td>2</td>
</tr>
<tr>
<td>Recorder.ArmStrip(i)</td>
<td>Arming Input Status</td>
<td></td>
<td>2</td>
</tr>
<tr>
<td>Recorder.ArmBus(i)</td>
<td>Arming BUS Status</td>
<td></td>
<td>2</td>
</tr>
<tr>
<td>Recorder.mode.recbus</td>
<td>0 (off) or 1 (on)</td>
<td>0 to record inputs</td>
<td>2</td>
</tr>
<tr>
<td>Recorder.mode.PlayOnLoad</td>
<td>0 (off) or 1 (on)</td>
<td></td>
<td>2</td>
</tr>
<tr>
<td>Recorder.bitResolution</td>
<td>8, 16, 24, 32</td>
<td>32 is float type</td>
<td>2</td>
</tr>
<tr>
<td>Recorder.Channel</td>
<td>1 - 8</td>
<td></td>
<td>2</td>
</tr>
<tr>
<td>Recorder.kbps</td>
<td>For mp3 format</td>
<td></td>
<td>2</td>
</tr>
<tr>
<td>Recorder.FileType</td>
<td>1 = WAV, 2 = AIFF, 3=BWF, 100 = MP3</td>
<td></td>
<td>2</td>
</tr>
<tr>
<td>Recorder.gain</td>
<td>-60 to +12 db</td>
<td>Gain slider</td>
<td>2</td>
</tr>
</tbody>
</table>

i= zero based index (0 to 5).
Special Commands:
Special Commands are not made to change parameter but to make an action. Here some command presented in the menu (write only of course).

<table>
<thead>
<tr>
<th>Command Name</th>
<th>Value Range</th>
<th>Remark</th>
<th>Ver.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command.Shutdown</td>
<td>1</td>
<td>Shutdown Voicemeeter</td>
<td>1</td>
</tr>
<tr>
<td>Command.Show</td>
<td>1</td>
<td>Show Voicemeeter</td>
<td>1</td>
</tr>
<tr>
<td>Command.Restart</td>
<td>1</td>
<td>Restart Audio Engine</td>
<td>1</td>
</tr>
<tr>
<td>Command.Eject</td>
<td>1</td>
<td>Eject Cassette</td>
<td>1</td>
</tr>
<tr>
<td>Command.Reset</td>
<td>1</td>
<td>Reset All configuration</td>
<td>1</td>
</tr>
<tr>
<td>Command.Save</td>
<td>String</td>
<td>Complete filename (xml)</td>
<td>1</td>
</tr>
<tr>
<td>Command.Load</td>
<td>String</td>
<td>Complete filename (xml)</td>
<td>1</td>
</tr>
</tbody>
</table>

Typical use:.
Command.Restart = 1;// request to restart audio engine

Command.Load= "C:\My Documents\VMConfig1.xml"; // load Config File

NOTE: command requests are prioritary to other requests. It means other type of request could not be processed if in the same request packet than a command request. For example Shutdown Request, simply closes the program without processing next request. LOAD request reset all possible previous or next request present in the same packet.

EJECT cassette function (also present in the menu) is made to release audio file and let other applications access on it.
**VBAN Options:**
Voicemeeter remote API allows controlling VBAN features and all parameters presented on the VBAN dialog Box. Then it is possible to remote VBAN functions to route/send/receive audio to/from different computers.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Value Range</th>
<th>Remark</th>
<th>Ver.</th>
</tr>
</thead>
<tbody>
<tr>
<td>vban.Enable</td>
<td>0 (off) or 1 (on)</td>
<td>VBAN functions</td>
<td>1</td>

</tr>
<tr>
<td>vban.instream[i].quality</td>
<td>0 to 4</td>
<td>0 = Optimal</td>
<td>1</td>
</tr>
<tr>
<td>vban.instream[i].route</td>
<td>0 to 8</td>
<td>Strip Selector</td>
<td>1</td>
</tr>
<tr>
<td>vban.outstream[i].on</td>
<td>0 (off) or 1 (on)</td>
<td>Stream On/Off</td>
<td>1</td>
</tr>
<tr>
<td>vban.outstream[i].name</td>
<td>String</td>
<td>Stream Name</td>
<td>1</td>
</tr>
<tr>
<td>vban.outstream[i].ip</td>
<td>String</td>
<td>IP Address To</td>
<td>1</td>
</tr>
<tr>
<td>vban.outstream[i].port</td>
<td>16 bit range</td>
<td>PORT (Ethernet)</td>
<td>1</td>
</tr>
<tr>
<td>vban.outstream[i].sr</td>
<td>11025 to 96 kHz</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>vban.outstream[i].channel</td>
<td>1 to 8</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>vban.outstream[i].bit</td>
<td>VBAN data type</td>
<td>1 = 16 bits PCM</td>
<td>1</td>
</tr>
<tr>
<td>vban.outstream[i].quality</td>
<td>0 to 4</td>
<td>0 = Optimal</td>
<td>1</td>
</tr>
<tr>
<td>vban.outstream[i].route</td>
<td>0 to 8</td>
<td>BUS selector</td>
<td>1</td>
</tr>
</tbody>
</table>

i= zero based index (0 to 7).

Like in the VBAN Dialog Box the following parameters change are producing an Audio Engine Restart:

- vban.Enable
- vban.instream[i].port
- vban.instream[i].quality
- vban.outstream[i].quality

**VBAN SampleRate:**
11025, 16000, 22050, 24000, 32000, 44100, 48000, 64000, 88200, 96000 Hz

**VBAN Quality:**
0 (Optimal), 1 (Fast), 2 (Medium), 3 (Slow), 4 (very slow). Quality parameter is conditioning the size of internal stack (also the latency) to cope to possible network instability and then increase the stream stability if required. **Optimal** quality considers the network is able to transmit packet in real time (with a good regularity), while **very slow** quality considers the network can have timing problem and unexpected waiting cycles.

**VBAN Bit Resolution / data format:**
Allowed Format are 1 (16 bit PCM) or 2 (24 bits PCM).
**AUTO Ducking (Trigger):**
With the TRIGGER, it is possible to make auto ducking and control any parameters or function (REC button for example) according an input level.

In this example, the hardware input in#1 is the Microphone and the Strip(3) is the virtual input of Voicemeeter Banana (used to get music). This virtual input will be faded to -15 dB and medium EQ by -12 dB when the user will talk in the microphone, more precisely, when the microphone level will go over -13 dB (to be adjusted according microphone level).

“Level Option” allows user to mute his microphone on Voicemeeter to disable the trigger. Otherwise trigger is working even if the microphone is muted on Voicemeeter.
System Functions (to send command to Windows):
In Macro Buttons application, some instructions are made for operating system to send Keyboard Event or run “command line” like program. These special instructions, following a “function” like syntax, can be inserted in the request script, with instructions for Voicemeeet.

<table>
<thead>
<tr>
<th>System Command</th>
<th>Value Type</th>
<th>Remark</th>
<th>Ver.</th>
</tr>
</thead>
<tbody>
<tr>
<td>System.KeyDown(szKey)</td>
<td>String</td>
<td></td>
<td>1</td>
</tr>
<tr>
<td>System.KeyUp(szKey)</td>
<td>String</td>
<td></td>
<td>1</td>
</tr>
<tr>
<td>System.KeyPress(szKey)</td>
<td>String</td>
<td>Send Key Down + Key Up</td>
<td>1</td>
</tr>
<tr>
<td>System.Execute(exe, dir, arg)</td>
<td>Strings</td>
<td></td>
<td>1</td>
</tr>
</tbody>
</table>

These commands are not sent to Voicemeeeter but directly to operating system.

System Execute
This function works like a “CreateProcess” or SheelExecute under windows and allow to start any application with a command line argument.

```
System.Execute(szprogram, szworkdir, szcommand);
```

Example to open a web page with the internet explorer:

```
System.Execute("C:\Program Files\Internet Explorer\iexplore.exe", ","","-new www.voicemeeter.com");
```

ENVIRONMENT VARIABLES
It is also possible to use system environment variable by using %envname% syntax.
Example to run the Microsoft WRITE Editor application

```c
System.Execute("%windir%\write.exe","%TMP%","{}");
```

**RUNNING DOS APPLICATION**

To run command line program, you need to launch cmd.exe with /K command to specify you want to execute the command after...

Example to run ipconfig in a DOS window:

```c
System.Execute("%windir%\system32\cmd.exe","%windir%\system32","/K ipconfig");
```

/C Carries out the command specified by string and then terminates
/K Carries out the command specified by string but remains

Example to ping your internet router (usual address is 192.168.1.1):

```c
System.Execute("%windir%\system32\cmd.exe","%windir%\system32","/K ping 192.168.1.1");
```

**System KeyDown / KeyUp / KeyPress**

This functions allow to send a combination of 1 to 4 keys by a simple string describing this keyboard combination, like “CTRL+SHIFT + F10” or simply “0”.

```c
System.KeyDown(szKey);
System.KeyUp(szKey);
```

Example:

```c
System.KeyDown("A");
System.KeyDown("SHIFT+T");
System.KeyUp("A");
System.KeyUp("SHIFT+T");
System.KeyDown("CTRL+NP1");
System.KeyDown("ALT+F8");
System.KeyUp("CTRL+NP1");
System.KeyUp("ALT+F8");
```

KeyPress function send Down and UP message in a single function.

```c
System.KeyPress("CTRL+NP1");
System.KeyPress("ALT+F8");
```

</table>

**Send M.I.D.I. Message**

In Macro Buttons 1.0.1.1 it is possible to select 2x MIDI output devices, defining out1 and out2 MIDI device. Then it is possible to send MIDI messages to these devices by a simple script.

![MIDI Device Selection]

4x request types are implemented (channel 1 to 16):

```c
System.SendMidi("out1", "note-on", channel, note, velocity);
System.SendMidi("out1", "note-off", channel, note, velocity);
System.SendMidi("out1", "ctrl-change", channel, ctrl, value);
System.SendMidi("out1", "prg-change", channel, nPrg);
```

There is also a RAW DATA function to send any M.I.D.I. Message (including sys-ex).

```c
System.SendMidi("out1", "data", aa, bb, cc, ee, ff, gg, ...);
```

(In this function only, values are in HEXA-Decimal: 00 to FF)
Note that values are in decimal (0 to 127) in MIDI function except for data message, value are in hexa decimal (16 based 0 to F / e.g. 90 = 9 x 16 + 0 = )
Send VBAN-MIDI or VBAN-TEXT (Voicemeeter script)

With Voicemeeter version 1.0.3.5 / 2.0.3.5 it is possible to send MIDI message through VBAN-MIDI and Voicemeeter Script through VBAN-TEXT protocol. And the MacroButton application can also learn MIDI code coming from incoming VBAN-MIDI stream. Note that MIDI2VBAN application is also installed with Voicemeeter to convert physical MIDI I/O into VBAN-MIDI Stream.

To send message through VBAN protocol, you have first to activate and configure your VBAN output streams. This is located in MacroButton system menu: VBAN Configuration Dialog Box will allow to setup 2x VBAN MIDI streams and 2x VBAN TXT Streams:
Send MIDI command through VBAN Stream
Once you have configured output VBAN MIDI Stream, you can use the same instruction to send MIDI message to VBAN1 or VBAN2 stream:

4x request types are implemented (channel 1 to 16):

- System.SendMidi("vban1", "note-on", channel, note, velocity);
- System.SendMidi("vban1", "note-off", channel, note, velocity);
- System.SendMidi("vban1", "ctrl-change", channel, ctrl, value);
- System.SendMidi("vban1", "prg-change", channel, nPrg);

There is also a RAW DATA function to send any M.I.D.I. Message (including sys-ex).

- System.SendMidi("vban1", "data", aa, bb, cc, ee, ff, gg, ...);

Send Voicemeeter Request through VBAN Stream
Once you have configured output VBAN TEXT Stream, you can send a command script by using a section bloc starting by BEGIN_SECTION and ending by END_SECTION instruction:

BEGIN_SECTION("vban1")
Strip(0).mute=1; Strip(1).mute=1;
Bus(0).gain= 0.0;
END_SECTION

All Voicemeeter script written inside the section will be sent to VBAN1 TEXT Stream defined in the VBAN configuration Dialog Box. While the section below will send the script through VBAN2 TEXT stream:

BEGIN_SECTION("vban2")
Strip(0).mute=1; Strip(1).mute=1;

**Voicemeeter Remote API (for developer only)**

The requests described above are based on Voicemeeter remote API (delivered and installed with Voicemeeter as VoicemeeterRemote.dll). This API can be used by any third part application programmed in any language to control Voicemeeter and take advantage of all its features.

Since Voicemeeter 1.0.5.0 / 2.0.3.0, Voicemeeter Remote API provides an AUDIO API to process audio inside Voicemeeter in 3 Different point. Download SDK and get more information on our forum: [https://forum.vb-audio.com/viewtopic.php?f=8&t=346](https://forum.vb-audio.com/viewtopic.php?f=8&t=346)

Voicemeeter Latency

M.I.D.I. Mapping

Specifications

Known issues

Command line Installation
System Settings / Options

Open the following System Settings Dialog Box by the menu:

This modal dialog box will show you the status of the different audio devices currently used by Voicemeeter Banana.
- **SR**: is giving the current samplerate of the device (which can be different for each device. Voicemeeter is based on multi points and multi formats audio engine able to manage most of audio system configurations).
- **buf**: gives the current buffer size used by the audio device (Voicemeeter Audio engine support different buffering on all audio points).
- **Ch**: gives the number of channel managed by the devices (Voicemeeter can manage 1 to 2 channels on inputs and up to 8 channels on outputs).
- **r**: gives the bit resolution of the device (Voicemeeter uses 16bits resolution per default).
- **S**: means “share mode” (applicable for WDM device only. KS is usually in exclusive mode and MME in share mode. For WDM it depends on devices and audio engine mode).

**Note:** Output A1 device configuration gives the main audio configuration of Voicemeeter and the configuration of Voicemeeter virtual ASIO driver (Sample rate and buffer size). It also means that all audio processing done in Voicemeeter will be based on this sample rate (if some audio points work in another sample rate, conversion will be done automatically to this main sample rate).

In this dialog box, you can change the latency used by MME, WDM and/or KS audio drivers. Basically MME driver support buffering between 512 and 2048 samples, while WDM and KS can go down to 256 samples (that makes audio processing very closed to the real time – practically usable to sing on a song in real time – karaoke – or to play digital piano on music in real time).

Some PC configurations (or some audio devices) will work very well with minimal buffering values while other will not (the sound stream could be not stable and generates too much sound’s cut). That’s why per default MME device uses 1024 samples buffering while WDM device is using 512 samples (these default settings should work for 100% PC configuration cases).

Under Windows XP, WDM driver are not available. (That we call WDM driver is audio device driver that can be handled by Microsoft WASAPI, for better audio performances and quality). But some audio device can support KS interface and then provide low latency support.

Preferred Main Sample Rate can be used as a wish to make Voicemeeter run output device A1 in the wanted sample rate (44.1, 48, 88.2, or 96 kHz). But it also depends on the audio device current configuration (that could stay in its own sample rate anyway).

Engine mode provides a SWIFT mode to possibly improve real time (experimental option). WDM Input devices are driven in SHARED mode per default to avoid possible WASAPI Exclusive mode bug (see known issues).

**ASIO Driver support:**
Voicemeeter can use an ASIO driver as Output A1 (the main output). Then Voicemeeter will run in audio pro conditions (like any DAW using ASIO device).
If ASIO device is selected as output A1, Voicemeeter will send audio to the 8 first output channels. But it is also possible to get the first input channels of the ASIO device routed to Hardware Inputs of Voicemeeter. This is done by the ASIO PATCH allowing to select which ASIO channel will be used for IN#1 left & right, IN#2 left and right…

It is also possible to open the ASIO Control panel of the main output device by clicking on its name.

**Getting Optimal Latency:**

The choice of the Output A1 is critical since it gives the master sample rate and main buffer size. So we recommend to select your best audio device as output A1 (preferred ASIO if possible, WDM or KS otherwise) – with ASIO device the buffer size is given by the ASIO driver itself (that can usually be set by the ASIO Specific Control Panel of your audio board). But it is possible to specify a preferred ASIO buffer size (used if the driver accepts it).

To improve latency, you can also decrease the latency buffer size (for example down to 256) especially with WDM or KS devices. If using WDM devices, you can again reduce global latency (the time between microphone and speaker) by using SWIFT mode.

Activating WDM Input Exclusive mode (and Swift mode) will force audio engine to use smallest buffer with WDM input devices. But this exclusive mode could not be stable and produce various potential problems in the time (from audio crash to system freeze/crash – pending on audio driver and O/S – see known issues section at the end of this document).

Virtual I/O latency can also be optimized by decreasing the Internal Latency of the Voicemeeter VAIO driver by using specific VBCABLE Control Panel program. However decreasing internal latency can produce discontinued or non-working stream in some cases, pending on different buffering constraints (see VB-CABLE technical documentation).
Virtual ASIO driver are adding a single buffer to the global latency (the size of this buffer is given by the buffering of the output A1)

**LATENCY WARNING:**
CHANGING DEFAULT LATENCY, BY REDUCING BUFFER SIZE CAN DECAY THE AUDIO STREAM, BRING UNSTABILITY, FREQUENT AUDIO CUT, STATIC, SYNCHRO LOST (ROBOTIC VOICE).

If you get such problem, come back to default buffer size.

**Patch Composite**
Patch composite allows selecting inputs used in the 8 channels of the composite mode. It's possible to switch PRE-FADER input to POST-FADER inputs by click on “Select Pre-Fader inputs…”.

The COMPOSITE Mode is used to get a composite signal on a BUS and be able to send or record different channels, composed by given inputs (see USE CASE #3 in Voicemeeter User Manual).
Patch Insert
The Patch Insert allows activating insert for each input channel. This is applicable only if an application is connected to the Voicemeeter Insert ASIO Virtual Device Driver. This driver supports a single client to work as a pre-fader insert on possible 22 channels composing the 5 strips of Voicemeeter. Then it's possible to use a VST Plug-in Host for example to insert plug-ins on any Voicemeeter inputs.

We made successful test with Minihost Modular Application (from Image Line Company: www.image-line.com)
M.I.D.I. Mapping:
Voicemeeter allows connecting a MIDI remote surface to control gain, mute, solo buttons of every strips and busses.

You just need to select the right MIDI device and enter in Learn process to configure the M.I.D.I. Mapping. This is expected to work with whatever M.I.D.I. Remote. You can even give a title to your mapping and store it on disk or recall it from XML files.

Click on Learn (use TAB or up/down arrow key to learn next/previous control) and move your M.I.D.I. Control. Click on M.I.D.I. Code area (black) to reset the M.I.D.I. Implementation (as it was before learning process).

PTT option means “Push To Talk” and un-mute the related strip when pushing the button, mute it when release it.

RESET MAP: reset entire M.I.D.I. mapping
LOAD / SAVE allow to recall and save M.I.D.I. Map from or to file (xml file).

M.I.D.I. Map name is a name defined by user to identify precisely the remote surface (stored in M.I.D.I. Map XML file).
### Specifications:

Voicemeeter Banana I/O Diagram:

Like a regular mixing console, Voicemeeter Banana can be represented with a usual I/O Diagram even if connections are not made by real wire, principles stay the same.

Note that Virtual I/O provide Windows Interface (MME, KS, WASAPI, DirectX…) and ASIO Interface (defined by Steinberg gmbh). It allows connecting regular windows audio application as well as audio pro DAW using ASIO devices only.
KNOWN ISSUES / RECOMMENDATIONS

Voicemeeter has been validated on different levels and should work 100% in most configurations. However we have notified some few issues, mainly related to general system configuration and Windows Audio Scheme understanding.

No sound anymore on my computer!
Voicemeeter is like a mixing console, it must be connected correctly to work correctly. If you set Voicemeeter audio device as default device, Voicemeeter must be running (like switching ON your mixing console) otherwise there might be no sound on your computer. When Voicemeeter is running, it can get exclusive access to selected output device (A1, A2, A3) and prevent other applications to use these playback devices. As Virtual Audio Mixer, all audio sources should be connected to Voicemeeter to avoid possible conflict. When you connect your mixing console to your amplifier, you connect nothing else to this amplifier and all sources are connected to your mixing console. It’s the same with Voicemeeter.

Voicemeeter does nothing if you don’t use it
Voicemeeter application and Voicemeeter virtual audio device drivers do nothing if you don’t use them and they cannot disturb or corrupt your system. If there is no sound anymore, it’s because a bad audio configuration. Then you just have to check your default audio device in Windows Control Panel / Sound Dialog Box (what is your default playback or communication device? What is your default recording device ?…), and check the audio configuration of some possible application that you previously configured to work with Voicemeeter (typically Skype).

Audio Stream becomes bad (sound is choppy, discontinued):
If the audio stream is not stable in the time, with too much cut in the sound, it means your configuration does not support the current buffering latency on one of your audio device (usually the one used for output A1). In this case you can increase the buffering in Voicemeeter System Settings Dialog Box (768 or 1024 samples for WDM). If it’s not enough, select MME audio device instead of WDM (especially for Output A1) because if Output A1 is not stable, it can disturb all other audio stream: Output A1 Audio device is master while all other audio points are slaves.

Output A1, A2 and A3 are not exactly synchronized.
On Voicemeeter every i/o are independent and we can hear more or less delay between them, especially when using 3 audio outputs: if A1,A2 and/or A2 are routed to 2 or 3 audio devices, the sound might be not exactly synchronized (one speaker output can be late and produce a small echo with other speaker output). This is normal (according technical constraint) but can be corrected by compensate one audio output with a delay line (see System Settings Dialog Box).

Voicemeeter Audio Stream can be stopped (no more sound, no meter display).
It can happen when changing audio system configuration (in Windows Control Panel / Sound properties) or when plug or unplug USB device or when launching other program that could use same audio device … In this case, simply restart audio engine or re-select an audio device out A1 or input 1 or any other in Voicemeeter. It will restart audio stream automatically (otherwise it could mean that audio device are used by other process and cannot be used anymore by Voicemeeter).

Audio Stream is stopped or corrupted after working well several hours.
If “WDM Input Exclusive Mode” is set when using WDM device as input, some PC/Audio driver configuration can be not stable and produce this unexpected behavior (including pops and cracks in the sound) after hours of perfect streaming. In this case the workaround is to disable Input Exclusive Mode in Voicemeeter System Settings (this is done by default) or use MME or KS audio device on Inputs (instead of WDM device driver).
Command Line Installation:
It is possible to make an automatic installation (or de-installation) by using command line options. However it will need to reboot after installation (and after de-installation). So it’s recommended to first call the setup program to uninstall possible previous version, then reboot, and then install new version (and reboot again).

-\(h\) : to hide GUI
-\(i\) : to install
-\(u\) : to uninstall

Voicemeeter Command Line:
Voicemeeter.exe and VoicemeeterPro.exe support some command to restart audio engine or to run Voicemeeter with a pre-defined configuration file. It allows for example to add different shortcut on the desktop to run Voicemeeter for different jobs.

To Restart Audio Engine by a shortcut use the following command line.

`Voicemeeter.exe -R` (or “-r”)

It can be useful to restart audio engine from a shortcut, for example to re-activate a known USB headset already connected to one Voicemeeter hardware input, but not physically plugged to the computer. When re-plugged to the computer, Voicemeeter Audio Engine has to be restarted to make it work again.

To run Voicemeeter with a specific configuration file, use these following command lines (Voicemeeter must have been shut down before – if Voicemeeter is already running, it will do nothing):

-\(l\)“filename.xml” or -\(L\)“filename.xml”

If the xml is in the same directories of voicemeeter.exe

-\(l\)“filename.xml” or -\(L\)“filename.xml”

If the xml is in the same sub directories of voicemeeter.exe

-\(l\)“subfolder\filename.xml” or -\(L\)“subfolder\filename.xml”

Or you can use absolute patch

-\(l\)“c:\folder\filename.xml” or -\(L\)“c:\folder\filename.xml”
